Abstract of JP10018695

PROBLEM TO BE SOLVED: To make compact and simple a guide mechanism on the folding-door free end side, and to improve workability on the installation of a folding door in a folding door device, in which the base end section of the folding door is pivoted to one side face of an opening section and a free end section is pivoted to a moving body movably engaged with a guide rail disposed on the inside from the folding door in a spread attitude closing the opening section. **SOLUTION:** A moving body 14 is composed of a roller unit 16 capable of being retracted only from the end section of a guide rail 13 and being movably fitted to the guide rail 13, an arm base section 17 extended from the roller unit 16 to the folding door side, and an arm front end section 18 pivoted by the vertical support shaft 38 of a folding-door free-end side pivoting means 15. The arm base section 17 and the arm front end section 18 are mutually connected detachably.
